                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) cligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC09989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00010-ABF99989, ABH0010-ABF9989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99889, ABF00010-ABF99889, ABH00010-ABH99889 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                             SNP, single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; peptide nucleic acid; cytosine methylation; cardiovascular; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide SEQ ID NO 46725 for detecting SNP TSC0013471.
                                                                                                                                                                                                     Oligonucleotide SEQ ID NO 42518 for detecting SNP TSC0012671.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; SEQ ID NO 42518; 29pp + Sequence Listing; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 13;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF8073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, azdiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; centrol nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABH0010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
and cytosine methylation status in chemically pretreated genomic DNA. The objognosis are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF8073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a central nervous system, acadiovascular and metabolic discoders. The oligomers are also used for acadiovascular and metabolic discoders. The oligomers are also used for acadiovascular and metabolic discoders. The represent the oligomers described in the invention. ABC0010 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                       Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                              This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cointral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABE99989 and ABI00010-ABE82073 tepseent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at
-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The coligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABE99989, ABH00010-ABE99989 and ABI00010-ABI82073 data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99889, ABC00010-ABH99889 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form mat of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99899, ABH00010-ABH99899 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABE9989, ABH00010-ABE9989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequence

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically prerreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and merabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WPPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                           -13
                                                        Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide SEQ ID NO 153320 for detecting SNP TSC0038760.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at fitte. WiPo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                        Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligonucleotide SEQ ID NO 178020 for detecting SNP TSC0044112.

The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99999 and ABI00010-ABI82073 trepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99989, ABF00010-ABF99989, ABF00010-ABF99989, ABF00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABC0010-ABE99899, ABC0010-ABE99989, ABC0010-ABE99989, and ABI0010-ABE99989 and ABI0010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; anti-HCV; viral replication; degenerative, disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; target; ss.
                                                                                                                                                                                                                                                                                                                                                                                       Set of Oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 tepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SNP, single nucleotide polymorphism, human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

The Ikaros gene encodes a zinc finger protein which can be used in a therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is at risk for an immune disorder. It is of particular use in treating a disorder of the corpus striatum. Heterologous genes may be expressed by placing them to under the control of an ikaros responsive control element and contacting the element with an ikaros protein. Potential high affinity binding sites for the Irak-alpha, beta and delta, the CD3-delta, -peptlon and -gamma of the TCR-alpha, -beta and -delta, the CD3-delta, -peptlon and -gamma of other T cell restricted antigens. Related sequences to the Ikaros of other T cell restricted antigens. Related sequences to the Ikaros motif were also found in the purine boxes of the IL2 gene in the in the INY long terminal repeat. See also AAG61504-Q61543. (Updated on 10-MAR-INY long terminal repeat. See also AAG61504-Q61543. (Updated on 10-MAR-INT) to add missing OS field.) (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lkaros; mIK; transcription factor; mouse; lymphocyte;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠ
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, or nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV practically bind the Enhancer I region of HBV genes and MBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepstcoellular carcinoma. The present sequence represents a target for one of the anti-
                                                                                                                                                                                                                                                                                                                                       Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This oligonucleotide from the T cell receptor alpha enhancer was identified as a potential high affinity binding site for Ikaros proteins (see AMY70851-71). It partially includes the core motif GGGAA found in consensus recognition sequences for murine Ikaros isoforms mIk-1, mIk-2 and mIk-3 (see AAV52830-32). High affinity binding sites for Ikaros have the TCR antigen complex, the CD3 genes, the SL3 and HIV long terminal repeat and in chancer and promoter regions of the regulatory domains of the TCR antigens complex, the CD3 genes, the SL3 and HIV long terminal repeat and in the regulatory domains of other T cell restricted antigens (see AAV45258-402) by gel retardation assay. Ikaros is involved in early differentiation of lymphocytes. The invention provides Ikaros nucleic acids (see AAV4205-11 and AAV4484) and polypeptides, vectors and host cells. These are used to treat T and B cell diseases, to control calls. These are used to treat T and B cell diseases, to control responsive element, to treat nervous system diseases and to modulate cell division, amplification or differentiation, especially in haematopoietic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ikaros poly:peptide(s) - useful for treating disorders of immune system or corpus striatum.
New nucleic acid encoding Ikaros protein involved in early differentiation of lymphocytes - existing in several isoforms, and related products, used to treat e.g. immune diseases or cancer and to control cell differentiation.

```
The present invention describes a purified peptide having at least one of the following properties: (a) it stimulates transcription of a DNA CC the following properties: (a) it stimulates transcription of a DNA consensus sequence under the control of a delta A element or an inverse binding oligonucleotide consensus sequence; (b) it binds to any of a delta A element; an NFKB element or an inverse binding oligonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring inverse binding oligonucleotide consensus sequence; (d) it competitively inhibits protein interactions of transcriptional complexes (c) it inhibits protein-protein interactions of transcriptional complexes formed with naturally occurring interactions of transcriptional complexes (c) it inhibits protein-protein interactions of independent of delta A elements. NFKB elements and/or independent oligonucleotides, competitively inhibit binding of naturally occurring interos binding oligonucleotides, competitively inhibit interactions of transcriptional complexes with continuity protein-protein interactions of transcriptional complexes with continuity protein-protein interactions of transcriptional complexes with continuity protein-protein interactions of transcriptional complexes with disorders, e.g. leukaemia or AlDS, or corpus striatum disorders, e.g. alzheimer's disease. AAV66975 to AAV67118 represent oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Forms double stranded region with bases 14-11 of sequence appearing as AAS12680"

sequences obtained from both wild-type tubercle bacilli (WITB) that are susceptible to a drug and mutant-type tubercle bacilli (WITB) that are susceptible to a drug and mutant-type tubercle bacilli (WITB) that are resistant to a drug. The drugs used in the present invention are rifampicin (RFP), streptomycin (SM), kanamycin (KM), isoniazid (INH) and chambucol (BB). The prob gene is responsible for resistance to RFP; the rrs gene is responsible for resistance to SM, the inhA gene is responsible for resistance to INH; the katG gene is responsible for resistance to INH; call the embB gene is responsible for resistance to INH; call the embB gene is responsible for resistance to INH; call the embB gene is responsible for resistance and the embB gene is responsible for resistance and convention also relates to nucleic acid probes having part of a nucleic sequence of tubercle bacilli (TB) responsible for drug resistance and primers used to generate the probes. The present sequence is an oligonucleotide of the present invention can be used to enable the differentiation of drug resistance and the determination of infection with tubercle bacilli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hepatitis C virus, HCV; internal ribosome entry site element; IRES; ss; 40S ribosome subunit; domain IIId; domain IIIe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a synthetic RNA catalyst capable of cleaving an RNA substrate, the catalyst comprising a substrate binding portion and a "hairpin" portion, i.e. a hairpin ribozyme. The RNA catalyst is used for cleaving RNA substrates, e.g. RNA from Human Immunodeficiency virus (i.e. an anti-viral substrates) e.g. RNA from Human immunodeficiency virus (i.e. prokaryotes and eukaryotes. The present sequence is mutated substrate RNA of a hairpin ribozyme sequence of the invention, from Tobacco ringspot virus. Note: The present sequence does not appear in the specification but is derived from the substrate RNA molecule shown in Pigure 42C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotides, nucleic acid probes and primers are useful for differentiating drug-resistance and determining infection with tubercle

The present invention relates to a new computer for producing three dimensional representation of a molecule. The computer of the invention comprises a machine-readable data storage medium, a working memory for storing instructions, a central processing unit coupled to the working memory and machine-readable data storage medium and a display coupled to the central processing unit. The molecule comprises a hepatitis C virus (HCV) internal ribosomal entry site (IRES) element. The invention is useful for producing a three dimensional representation of a molecule comprising hepatitis Virus C IRES element, for identifying potential inhibitors of hepatitis Virus C IRES element, for identifying potential interactions of hepatitis Virus C IRES element, for identifying potential comprising hepatitis Virus translation and for modelling interactions of the IRES with its binding partner, the 40S tibosome subunit. The computer generates the three-dimensional representation of the HCV IRES stem loops in at least one of domain IIId or IIIe. The structural data permits the identification of atoms that are important for ADS subcompal subunit binding. The present mucleic acid sequence represents the hepatitis C virus internal ribosome entry site element domain IIIe of the invention. This sequence represents residues 290-303
                                                                                                                                                         Computer for producing a three dimensional representation of a molecule hepatitis C virus entry site element comprises a machine-readable device, data storage medium, working memory, central processing unit and display.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Papillomavirus; transactivator messenger; mENA function; inhibitor; infection; warts; feet; laryrx; condylomata acuminata; epidermodysplasia verruoiformis; flat cervical warts; cervical intraepithelial neoplasia; cancer; HPV; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide nucleic acid oligomers hybridisable to cytomegalovirus or papilloma:virus - are stable anti:sense molecules with high affinity for single stranded DNA, used for treating infections.
                                                                                                                                                                                                                                                                                                                                 The sequence (AAQ50059) shows the BPV-1 E2 transactivator gene, BPS 2443-4203, while sequence (AAQ50061) is the nucleotide sequence of the 5' common untranslated region of BPV-1 coding for early messenger RNAs showing the domain having nucleotides 89-304 See also (AAQ50062-97) for related nucleotides and their respective regions. The oligonucleotides are useful for treating papilloma virus infections, such as warts of the hands, feet and larynx, condylomate acuminata, epidermodysplasia veruciformis, flat cervical warts and cervical intrapithelial neoplasia. They may also be used to regulate the growth of cancer cells which carry HPV. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                               Papilloma virus anti sense oligo nucleotide inhibition - useful to treat warts, condylomata acuminata and to regulate growth of cancer cells carrying human papillomavirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                  New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, 5 untranslated region, intron/exon (I/E) junction or coding sequence of cytomegalovirus gene selected from DNA polymerase, IEI and IEE, or pytomegalovirus gene selected from DNA polymerase, IEI and IEE, or pytomegalovirus The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a lirst PNA strand binds with RNA or ssDNA and a second PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand binds with the area water soluble, which facilitates possess no significant charge and are water soluble, which facilitates cellular uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence targets papillomavirus 5'-coding region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr.abl; oncogene; translocation; chromic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atheroselerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoind arthritis; psoriasis; myocardial ischaemia; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves interleukin-5 (IL-5) mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the IL-5 target sequences and thereby inhibit IL-5 expression, making them useful for treating chronic asthma, e.g. by inhibiting the synthesis of IL-5 in lymphocytes and preventing the recruitment and activation of eosinophils. The ribozymes can also be used to treat eosinophilia (related to parasitic infection or with pulmonary infiltration) and L-tryptophan-associated eosinophilia-myalgia syndrome.                                                                                                                                                                                                                                                                                                                      AAT00455-T00474 represent oligonucleotides targetted at the E2 mRNA of bovine papillomavirus 1 (BPV-1). This sequence is targetted against a portion of the 5' coding region. These sequences were used to design antisense phosphorothiote oligonucleotides against HPV-11 E2 mRNA, such by F151 2105 (see AAT00450). The HPV-11 E2 antisense oligonucleotides and thereby inhibit E2-dependent transactivation. The HPV-11 E2 mRNA (preferably the AUG region) and thereby inhibit E2-dependent transactivation. The HPV-11 oligonucleotide sequences (and analogues of them) can interfere with, or modulate the function of mRNA. The sequences can be used for the diagnosis and treatment of HPV infections. They can also be used for the detection and quantification of HPV in samples. (Updated on 25-MRR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                         A claimed enzymatic RNA mol. for the cleavage of apolipoprotein (a) (apo(a)) mRNA, specifically a hammerhead ribozyme, has binding arms complementary to the present acquence (nucleotide position 10532). The ribozyme blocks to some extent apo(a) expression, and can therefore be used to diagnose or treat conditions related to lipoprotein (a) levels, e.g. atherosclerosis, myocardial infarction, stroke, restenosis and heart disease. PCR was used to generate a substrate for 17 RNA polymerase transcription from monkey apo(a) CDNA clones. Labelled transcripts were synthesised in vitro to form 2 templates. The oligonicleotides and labelled transcripts were annealed, RNaseH added and the mixts incubated. After a designated time the reactions were stopped, and RNA sept. on sequencing polyacrylamide gels. The percentage of substrate cleaved was determined by autoradiographic quantification, and the most
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enzymatic RNA mols. which cleave apo(a) mRNA - useful in diagnosis and treatment of conditions related to Lp(a) levels, e.g. atherosclerosis, myocardial infarction, and heart diseases.

A claimed enzymatic RNA mol. for the cleavage of apolipoprotein (a) (apo(a)) maRNA, specifically a harmerhead ribozyme, has binding arms complementary to the present sequence (nucleotide position 10543). The ribozyme blocks to some extent apo(a) expression, and can therefore be used to diagnose or treat conditions related to lipoprotein (a) levels, e.g. atherosolerosis, myocardial infarction, stroke, restenosis and heart disease. PCR was used to generate a substrate for T7 RNA polymerase transcription from monkey apo(a) DNA clones. Labelled transcripts were synthesised in vitro to form 2 templates. The oligonucleotides and labelled transcripts were annealed, RNaseH added and the mixts. Incubated After a designated time the reactions were stopped, and RNA sept. on sequencing polyacrylamide gels. The percentage of substrate cleaved was determined by autoradiographic quantification, and the most accessible ribozyme target sites chosen

A claimed enzymatic RNA mol. for the cleavage of apolipoprotein (a) (apo(a)) mRNA, specifically a hammerhead ribozyme, has binding arms complementary to the present sequence (nucleotide position 10570). The ribozyme blocks to some extent apo(a) expression, and can therefore be used to diagnose or treat conditions related to lipoprotein (a) levels, e.g. atherosclerosels, myocardial infarction, stroke, restenois and heart disease. PCR was used to generate a substrate for T7 RNA polymerase transcription from monkey apo(a) cDNA clones. Labelled transcripts were labelled transcripts were annealed, RNaseH added and the mixts. Incubated. After a designated time the reactions were stopped, and RNA sept. on sequencing polyacrylamide gels. The percencage of substrate cleaved was determined by autoradiographic quantification, and the most accessible ribozyme target sites chosen

The present invention describes an oligonucleotide or oligonucleotide analogue consisting of 8-50 bases which specifically hybridises to a cap or transrepressor region of the E2 mRNA from a papillomavirus. The oligonucleotide can be used as a hybridisation probe for detecting papillomavirus in a sample or for antisense therapy of papillomavirus infections or for research. The present sequence represents a bovine papillomavirus (BPV-1) E2 antisense oligonucleotide given in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonuclectide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

                                                                                                                                       cancers,
                                         Nyce JW;
  The specification describes antisense oligonucleotides (AAX52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55180-271 can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasconstriction, inflammation, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
cute asthma, allergies, asthma, impeded respiration respiratory
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, menastasized
colon cancer, breast cancer, lung cancer, melanoma, hepatic metastases, as
well as all types of cancers which may metastasize
to the lungs, including breast and prostate cancer
                                                                                                         New antisense oligonucleotides used in treatment of, e.g. pulmonary

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                  Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection.

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 265; 1592pp; English.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (C) isomulated the antisense oligonucleotides and (I) can be used to down-regulate the mannosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and cativity disorders and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines receptors, adenosine receptors, cytokines and chemokine receptors, adenosine receptors, cytokines and chemokine receptors, adenosine receptors, cytokines and chemokine receptors, adenosine receptors, bradykinin receptors, contain error and pertipheral nervous and non-nervous system continues system (CMS) and pertipheral nervous and non-nervous system continues oligonucleotides may be used in this way to trast disorders including respiratory obstruction (especially pulmonary obstruction) which are associated proteins. The condition selected from pulmonary vasoconstriction, inflammation, condition selected from pulmonary vasoconstriction, inflammation, allergies, athan, cystic fibrosis (CP), allergic thinitis (AR), pulmonary transplantation relection, pulmonary disease (COPD), and hor taken and allergia remained and antibute respiration, respiratory disease (COPD), and hor fancer and antibuted and allergic fibrosis (CP), allergic thinitis (AR), pulmonary and conditions and antibuted and allergic thinitis (AR), pulmonary infections, breaded and antibuted and antibuted and allergic fibrosis (CP), allergic remains and antibuted and allergic and antibuted and antibuted and antibuted and allergic and antibuted and antib and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of the present invention

```
The sequence represents an allele specific oligonucleotide probe for genotyping individuals using the Human gene encoding the ml muscarinic cacetylcholine receptor. FiRMI. CHMR1 is one subtype of a family of 5 genetically distinct muscarinic accetylcholine receptors, mAChE, that play important roles in higher brain function such as learning and memory. The protein is a possible drug target for treatments for Alzheimer's disease and antibodies raised against the protein are useful for diagnosing and antibodies raised against the protein are useful for diagnosing and expression of the gene or activity of the protein, e.g. Alzheimer's disease and dementia with Lewy bodies
                                                                                               New variants of the ml muscarinic acetylcholine receptor gene, useful to find treatment for Alzheimer's and dementia, have single nucleotide variations at one or more of five polymorphic sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide useful for inhibiting telomerase activity in cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma; breast; prostate; colon; mixed cell leukaemia; Hodgkin's disease; fertility; inflammatory condition; tumour; cancer; veterinary; immunosuppression; telomerase inhibitor; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genomic DNA encoding Plexin.BI, in the region of the alternative splicing of the extracellular domain. Plexins are large transmembrane proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately $00 amino acid Semaphorin domain. The plexin useful in diagnosis, therapy and in the biopharmaceutical industry. In particular, the plexin polymucleotides and polypeptides are useful for particular, the plexin polymucleotides and polypeptides are useful for particular, the plexin polymucleotides and polypeptides are useful for treating compounds (e.g. plexin-specific binding agents or antibodies) for treating or diagnosing a disease or disorder involving aberrant cell growth (e.g. hyperplasia, neoplasia, cancer or neurodegenerative diseases or disorders involving aberrant immune regulation (e.g. ununosuppressive diseases or blabetes Type I), or immunosuppressive diseases such as multiple sclerosis or rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                        New plexin polynucleotides and polypeptides, useful in diagnosis, therapy and in producing compounds for treating diseases involving aberrant cell growth (e.g. cancer) or immune regulation (e.g. autoimmune diseases).

The invention relates to polymucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polymucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase activity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative diseases. Inhibition of telomerase in haematopoietic stem cells is useful for menosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human telomerase polymucleotide inhibitor #13, as described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New oligonucleotides capable of inhibiting the function of an mRNA from a papillomavirus when hybridized to the viral mRNA useful for diagnosing, treating or preventing papillomavirus infection e.g., warts of the hands, feet or larynx.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense therapy; dermatological; anticancer; virucide; papillomavirus;
tor treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The method comprises contacting the skin with an antisense oligonucleotide, (for Insulan-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBPP], which is capable of inflammation or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45152-F45161). The method is useful for ameliorating the effects of psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological; cardiant; virucide, ophthalmological; keloid, shi discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding procter; IGFBP-2; IGFBP3; inflammation; psoriasis; pitaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keatoolsis, neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neoblasia; kidney disease;

        The present sequence is an antisense oligonucleotide for a papillomavirus. When the antisense oligonucleotide hybridises to a papillomavirus mRNA, the function of the mRNA is inhibited. The oligonucleotide is useful for the diagnosis and treatment of infections in animals caused by papillomavirus, such as warts of the hands, feet or larynx, condylomata acuminata, epidermodysplasia vertuciformis, flat cervical warts, cervical intraspithelial neoplasia, or other infections introdying a papillomavirus. Note: the present sequence may have a

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 6; Page 34; 201pp; English.

skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborkhea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a meovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic present invention relates to a method for ameliorating the effects of

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 7; Page 58; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomuclectide, (for Insulan-Ilke Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomuclectide which can be used to design the antisense oligomuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the skin, a brain or skin, growth factor-mediated malignancies, other sclerotic states of disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 6, Page 42; 201pp; English.

The present invention relates to a method for ameliorating the effects of artisense oligonucleotide, (for Insulin-like Growth Factor [IGF] and antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]) receptor, IGF binding protein [IGFBP] - 2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153 oligonucleotides of the present invention (see AAF4151 and AAF45153 oligonucleotides of the present invention (see AAF4151 and AAF45153 nepthysosis, pityriasis, ruba, plaris, serborrhoea, keloids, keratosis, inchthyosis, pityriasis, banign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic and season of the inside of blood vessels or any other hyperplasia

Example 7; Page 55; 201pp; English

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antibodied comprises contacting the skin with an arbitrance oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, Influention and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153-CPF5161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic condition of the inside of blood vessels or any other hyperplasia

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-IRG Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-1) and method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborthoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovagcular condition such as a neoviscular condition of the retina,
                                                                                                                                                                                                                      cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFB-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; kertosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasis; kidney disease; neovascular condition; hyperplasis; kidney disease;
                                                                                                                                                                                                   Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.5%; Score 11; DB 1; Length 15; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - 2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 - F45161). The method is useful for ameliorating the effects of psoriasis, inhyposis, pityriasis, ruba, pliaris, serborrhoea, Keloids, keratosis, inhyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                  Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis, IGF binding protein, IGFBP-2; IGFBP3; inflammation, psoriasis, pilatis, growth factor mediated cell proliferation, ichthyosis, serborrhoea; ruba, keratosis, neoplasia, scleroderma, wart, skin cancer; sclerotic disease, hypermeovascular condition, hyperplasis, kidney disease; neoblation of the retna; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]) receptor, IGF binding protein [IGFBB]-2 or IGFBB], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF4151 and AAF45153-F45161). The method is useful for ameliotrating the effects of psoriasis, ichthyosis, pityriasis, ruba, pitaris, serborrhoea, keloids, keratosis, theoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovacular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproprioliferation of the inside of blood
                                                                   Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; Keloid; skin discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; 1GFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neoblation of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAFF5151 and AAFF5153-F55151. The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, bilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovacular condition out as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological; keloid, skin disorder, Insulin-like Growth Factor 1 receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris;
Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological; cardiant; virucide, ophthalmological; keloid; stin discorder, insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFB-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keateosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neobascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AF45153-6150mucleotides of the present invention (see AAF45151 and AF45153-6160thyosis, pityriasis, ruba, plaris, serborrhoea, keloids, keratosis, incoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                               Edmondson SR;

IGFBP2 oligonucleotide #54.

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticonse oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [FIGF]-2 or IGFBF3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, or inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation is useful for ameliorating the effects of psoriasis, response of the present invention (see AAF45151 and AAF45153- F45161). The method is useful for ameliorating the effects of psoriasis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                  Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticontent dispancelectied, (for Insulin-like Growth Factor Insulin-like Growth Factor Insulin-content of Enderth is capable of inhibiting or reducing prowth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligomuclectide which can be used to design the antisense oligomuclectide which can be used to design the antisense oligomuclectide which can be used to design the antisense oligomuclectide with a present invention (see AAF45151 and AAF45153 oligomuclectide with invention (see AAF45151 and AAF45153 oligomuclectides of the present invention (see AAF45151 and AAF45153 oligomuclectides) privatisals, privatisals, plants, plants, serborrhoes, keloids, keratosis, neoplasts, scleroderma, warts, benign growths, cancers of the skin, a hypernecvascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood customers of the series or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor 1 receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGP] - receptor, IGF binding protein [IGFBP] - 2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the affects of psoriasis, stainly sis, pityriasis, ruba, pilaris, serborthoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, the brian or skin, growth factor—mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood to sessels or any other hyperplasia
                                                                     Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     O.5%; Score 11; DB 1; Length 15; Local Similarity 100.0%; Pred.                                                                                                                                  The present invention relates to a method for ameliorating the effects of artisense oligonucleotide, (for Insulin-like Growth Factor [IGF] artisense oligonucleotide, (for Insulin-like Growth Factor [IGF]) areceptor, IGF binding protein [IGFBP] - 2 or IGFBP3), which is capable inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 - 745161). The method is useful for ameliorating the effects of psoriasis, inhyporaeotides, bully plants, sephorthoea, Keloids, keratosis, inhyporaeovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproliferation of the inside of blood
           Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomuclectide, (for Insulin-11ke Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBB]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomuclectide which can be used to design the antisense oligomuclectide which can be used to design the antisense oligomuclectides of the present invention (see AAF45151 and AAF45153-156161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperiacyscular condition used as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to oligonucleotides based on nucleotide sequences obtained from both wild-type tubercle bacilli (wtTB) that are susceptible to a drug and mutent-type tubercle bacilli (mtTB) that are resistant to a drug. The drugs used in the present invention are rifampicin (RRP), streptomycin (SM), kanamycin (KM), isoniazid (INH) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New oligonucleotides, nucleic acid probes and primers are useful for differentiating drug-resistance and determining infection with tubercle

ethambutol (EB). The rpoB gene is responsible for resistance to RFP; the rrs gene is responsible for resistance to SM and KW; the rpsL gene is responsible for resistance to SM; the inhA gene is responsible for resistance to INH; the kacG gene is responsible for resistance to INH; and the embB gene is responsible for resistance to INH; and the embB gene is responsible for resistance to INH; and the crades to nucleic acid probes having part of a nucleotide sequence of tubercle bacilli (TB) responsible for drug resistance and primers used to generate the probes. The present sequence is an objection of the present invention. The oligonucleotides of the present invention. The oligonucleotides of the present invention of the present invention of the present invention of backing the determination of infection with tubercle bacilli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for haplotyping the human phospholipid transfer protein (PLTP) gene, involving determining the identity of the nucleotide present at one or more of the 25 polymorphic sites within the gene. This can be used to aid drug development for the treatment of diseases associated with different haplotypes of the PLTP gene, possibly including atherosclerosis. The present sequence is an allele-specific primer used for detecting polymorphisms in the PLTP gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genotyping phospholipid transfer protein gene of individual for haplotyping individual's gene, comprises determining identity of nuclectide pair at polymorphic sites for two copies of PLTP gene present in the individual.
                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, phospholipid transfer protein, PLTP; SNP, atherosclerosis, single nucleotide polymorphism, high-density lipoprotein metabolism; allele-specific oligonucleotide; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genotyping human Growth hormone releasing hormone receptor gene of individual for determining haplotype of individual by determining identity of nucleotide pair at specific polymorphic sites for two copies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human growth hormone releasing hormone receptor (GHRHR) gene located on chromosome 7p14, and methods for haplotyping and/or genotyping the GHRHR gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the GHRHR gene polymorphisms. The polymorphisms accerned compounds are useful for the treatment of diseases associated with GHRHR activity, such as isolated growth hormone deficiency (IGHD) and pituitary adenomas. AAS19609-AAS19621 represent ASO probes for detecting human GHRHR gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to single nucleotide polymorphisms in the human neuropeptide Y receptor Y1 (NPYIR) gene. A method for haplotyping the neuropeptide Y receptor Y1 (NPYIR) gene. A method for haplotyping the NPYIR gene in an individual comprises identifying the nucleotide at one of more polymorphic sites and determining whether one of the copies of the gene is defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. The haplotype or haplotype pair of the NPYIR gene can be identified by comparing the frequency of the haplotype or haplotype pair. NPYIR and its corresponding DNA are used for studying the expression and function of NPYIR, for use in screening or cardiovascular diseases (e.g. hypertension) and depression. The sequences are also useful for studying the effect of variation on the biological activity of NPYIR s well as on the binding affinity of cardioate darugs crangeting NPYIR sequences AASSDS63-AASSDS63 represent allale-specific oligonucleotide probes, sequencing primers, PCR primers and PCR primer culversal tails used to detect NPYIR gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```

The patent discloses novel genetic variants of human apolipoprotein E (APOE) gene. The invention also relates to compositions and methods for haplotyping and/or genotyping the APOE gene. The haplotyping methods of the invention are useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with APOE activity, e.g. familial dyspetalipoproteinaemia, type III hyperlipoproteinaemia atherosclerosis, and Alzheimer's disease. They are useful to validate APOE as a candidate agent for treating a specific condition or disease predicted to be associated with APOE activity and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with APOE activity. Genotyping or haplotyping methods are useful to screen for compounds targeting APOE activity. The present DNA sequence is an allele specific oligonucleotide (ASO) primer which is used for detecting human APOE gene polymorphisms Sequence 15 BP; 2 A; 3 C; 7 G; 2 T; 0 U; 1 Other; Similarity

Human CHRNE allele-specific oligonucleotide (ASO) primer, SEQ ID NO:36.

Human, cholinergic receptor nicotinic epsilon polypeptide, CHRNE, chromosome 17p13-12; acetylcholine receptor; AChR, neuromuscular junction; skeletal muscle; postnatal development;

```
The invention relates to a method for haplotyping the cholinergic receptor, nicotinic, epsilon polypeptide (CHRNE) gene (AB188268) of an individual, and also describes 17 novel polymorphic sites within the human CHRNE gene. The CHRNE gene is located on chromosome 17pi3-12 and contains 12 exons which encode a 493 amino acid protein (ABB49112). The CHRNE protein is one of the 5 subunits of mammalian acetylcholine adults, and is essential for the normal postnatal development of skeletal adults, and is essential for the normal postnatal development of skeletal wisttenions in the CHRNE gene are associated with congenital compact of CHRNE gene is also useful for studying the expression of CHRNE, and in expressing CHRNE protein for use in gene therapy. The CHRNE gene is also useful for studying the expression of CHRNE, and in expressing CHRNE protein for use in an extending the crandidate drugs to treat diseases related to CHRNE. The method of the invention is useful for haplotyping the CHRNE gene in an extension of the invention also be used in pharmaceutical research to validate crandidate drugs for, treating a specific condition drugs or disease condidate drugs for, treating a specific condition drugs of disease confident to be associated with CHRNE scivity such as CMS. Polymorphisms of primer extension using oligomodecated with CHRNE scivity and reliability of several steps in the discovery and reliability of several steps in the discovery and ethiospan of drugs for treating diseases associated with CHRNE sequences of discomment of drugs for treating diseases essociated with CHRNE sequences activity, and may be used to screen drugs which target CHRNE. Sequences activity, and may be used to screen drugs which target CHRNE. Sequences of Sulganza or propersent specifically claimed allele-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

```
The present invention describes an isolated human period (Drosophila)
homologue 1, (PER1) polymucleotide (I) comprising a sequence which is a
homologue 1, (PER1) polymucleotide (I) comprising a sequence which is a
correct the present for a reference sequence (ABL52079) for the PER1 gene
or its fragment, or a polymorphic variant of a reference sequence
(ABL52078) for a pert oblymorphic variant. The present invention also
describes methods for genotyping and haplotyping the PER1 gene of an
individual. (I) is useful in studying the expression and function of
PER1, and in expressing PER1 protein for use in screening for candidate
drugs to treat diseases related to PER1 activity. (I) is useful for
therapeutic purposes. A recombinant non-human organism transformed or
transfected with (I) can be used for studying expression of the PER1
isogenes in vivo, for in vivo screening and testing of drugs targeted
against PER1 protein, and for testing the efficacy of therapeutic agents
and compounds for disorders associated with circadian rhythm regulation.
The present sequence represents an allele specific oligonucleotide probe
for human PER1, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Cytochrome P450; Subfamily XXVIIA; single nucleotide polymorphism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated human period Drosophila homolog 1 polynucleotide, useful for therapeutic purposes, for studying the expression and function of the polynucleotide, and for expressing the homolog.
                                                                                                                                                                                                                                                                                   /note= "polymorphic site indicated by an ambiguity base"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a polymucleotide sequence comprising a human nuclear factor of kappa light polypeptide gene enhancer in B-cells chibitor, beta (NFRBIB) isogene. The NFRIBI is useful for screening for drugs and therapeutic purposes. The polymorphism and haplotype data is useful for validating whether NFRBIB is a suitable target for drugs to treat disorders of immune system, screening for such drugs and reducing bias in clinical trials of such drugs. NFRBIB is useful in studying the effect of variation on the biological activity of NFRBIB as well as on the binding affinity of candidate drugs. NFRBIB is useful in studying the system. The isolated monoclonal antibody is useful for diagnostic and prognostic formats and therapeutic methods. The genotyping method is useful for deapnostic and applotype pair. The haplotyping method is useful for improving efficiency and outcome of several steps in discovery and development of drugs for treating diseases associated with NFRBIB activity such as disorders of immune system. The haplotyping method is also useful for validating or predicted to be associated with NFRBIB activity. The method is also useful for screening compounds to treating a specific condition or disease consecution of the associated with NFRBIB activity. The method is also useful in the careful on chromosome 19013.1. The present sequence is human NFRBIB gene poymorphism detecting ASO (allele-specific coligonucleotide) primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·.

The present invention relates to a new human Cytochrome P450, Subfamily XXVIIA, (Steroid 27-Hydroxylase, Cerebrocendinous Xanthomatosis) Polypoptide I (CYP27-Hydroxylase, The polymorphic variant for a reference sequence which is a polymorphic variant for a reference sequence for the CYP27A1 gene or its fragment, or a polymorphic variant of a reference sequence for a CYP27A1 Gene or its fragment. The invention is useful for screening for drugs by contacting the CYP27A1 polymorphic variant with a candidate agent and assaying for binding a cativity. The invention is also useful in studying the expression and function of CYP27A1, and in expressing CYP27A1 protein for use in screening for candidate drugs to treat diseases related to CYP27A1 cativity, e.g. cerebrotendinous xanthomatosis. Other uses include for therapeutic purposes and for studying expression of the CYP27A1 isogenes in vivo screening and testing of drugs targeted against CYP27A1 protein, and for testing the efficacy of therapeutic agents and compounds for diseases associated with CYP27A1 activity, e.g. cerebrotendinous wanthomatosis. The invention is useful for studying the efficacy of therapeutic agents and cativity of CYP27A1 as well as on the binding affinity of candidate drugs crayered muchelc acid sequence represents one of a collection contact of the present nucleic acid sequence represents one of a collection of the human CYP27A1 activity of candidate drugs ware used in the invention to detect polymorphisms in the human CYP27A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated human Cytochrome P450, Subfamily XXVIIA, Steroid 27-Hydroxylase, Cerebrotendinous Xanthomatosis 1 gene, useful for therapeutic purposes, and for studying expression and function of the

Colony stimulating factor 1 receptor (CSF1R) oligonucleotide #68.

The invention describes a novel isolated polymucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimulating factor I receptor (CSPIR) gene, found on Thee CC colony stimulating factor I receptor (CSPIR) gene, found on Thee CC polypeptide are useful for improving the discovery and development of malignant historycosis, myeloid malignancies, and inflammatory disorders and the haplotypes can be used to validate CSPIR activity, e.g., and the haplotypes can be used to validate CSPIR, as a candidate target for treating a specific condition or disease predicted to be associated with CSFIR activity. Genotyping the CSFIR gene of an individual can also consequent in studying the expression and function of CSFIR, and in CC treat diseases related to CSFIR series and therapeutic treatments. (I) is useful in studying the expression and function of CSFIR, and in cudying the effect of the variation on the biological activity of GSFIR. Antibodies are binding affinity of diagnostic and prognostic formats and therapeutic useful as variety of diagnostic and prognostic formats and therapeutic CSFIR isogenes in vivo, for in vivo screening activity of GSFIR series of CSFIR procein, and for testing the efficacy of therapeutic agents and ormpounds. Allele specific oligonucleotides (ASO) care useful as probes and primers, and for testing the efficacy of therapeutic agents and compounds that are more likely to show method for identifying lead compounds that are more likely to show ceffect of any particular CSFIR or haplotype the invention provides a coligonucleotide primer used for detecting CSFIR gene polymorphisms, coligonucleotide primer used for detecting CSFIR gene polymorphisms, and the march of the march of the invention. Novel polymorphic variants of colony stimulating factor 1 receptor useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases e.g. inflammatory disorders. Homo sapiens,

The present invention provides the sequences of fragments of the human ubiquitin protein kinese E3A (human papilloma virus E6-associated protein) UBE3A coding sequence and protein. Also described are a number of single nucleotide polymorphisms (SNPs) identified within these fragments. The fragments can be used in the gene therapy of Angelman syndrome and to haplotype the UBE3A gene. The present sequence is an allele specific primer for a coding sequence fragment of the invention

Sequence 15 BP; 4 A; 1 C; 5 G; 4 T; 0 U; 1 Other;

```
The invention describes a novel isolated polynuclectide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimulating factor I receptor (CSFIR) gene, found on The following stimulating factor I receptor (CSFIR) gene, found on The drugs for treating diseases associated with CSFIR activity, e.g., and inflammatory disorders and the haplotypes can be used to validate CSFIR activity, e.g., and the haplotypes can be used to validate CSFIR activity, e.g., with CSFIR activity. Genotyping the CSFIR pence of an individual can also be used in developing disgnostic tests and therapeutic treatments. (I) is useful in studying the expression and function of CSFIR, and in corpressing CSFIR protein for use in screening for candidate drugs to treat diseases related to CSFIR activity and in studying the effect of the variation on the biological activity of CSFIR. Antibodies are binding affinity of candidate drugs targeting CSFIR. Antibodies are cuseful in a variety of disanostic and prognostic formats and therapeutic comethods. A transgent animal is useful in studying expression of the CSFIR probes and primers, and for testing the efficacy of therapeutic agents and compounds. Allele specific oligonuclectides (ASO) are useful as probes and primers, and for testing the efficacy of therapeutic agents and compounds. Allele specific oligonuclectides are method for identifying lead compounds that are more likely to show the control of the primers used for detecting CSFIR gene polymorphisms, and entered against that are useful as probes and primers. This sequence is an allele specific oligonuclectide primer used for detecting CSFIR gene polymorphisms, and activity and activity and an allele specific.

New genetic variants comprising haplotypes of the small inducible cytokine subfamily A, member 21 (SCYA21) gene, useful in improving the efficiency of screening for drugs for treating immunological disorders or for targeting SCYA21.
                                                                                                                                                                                                             The invention relates to a novel isolated polynucleotide comprising a small inducible cytokine subfamily A (cys-cys), member 24 (SCYA24) isogene. The polypeptide of the invention has antiasthmatic activity. The polynucleotide may have a use in gene therapy. The polynucleotide and polynucleotide are useful in the the development of drugs for treating diseases associated with SCYA24 activity, e.g. respiratory inflammatory diseases such as asthma. Allele-specific oligonucleotide (ASO) primers used for detecting polymorphisms in the SCYA24 gene are represented in ABLS7616-ABLS7645
                                                                                                            New genetic variants of small inducible cytokine subfamily A member 24 gene, useful in studying expression and function of the protein, and for screening drugs to treat diseases such as asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Small inducible cytokine subfamily A (Cys-Cys) member 21; SCYA21; polymorphism; haplotype; immunological disorder; gene expression; drug development; immunomodulator; allele specific oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SCYA21 gene allele specific oligonucleotide primer #7.

BP.

The invention describes an isolated polynucleotide, which comprises genes

Claim 14; Page 13; 56pp; English.

```
and haplotypes of the small inducible cytokine subfamily A (Cys-Cys),
member 21 (SCYA21) gene. The polynucleotide comprises polymorphic sites
referred to as PSI-5 to designate the order in which they are located in
the gene. The polymorphisms and haplotypes of SCYA21 gene are useful for
validating whether SCYA21 is a suitable target for drugs to treat
immunological disorders and disorders associated with its abnormal
expression or function, screening for such drugs and reducing bias in
clinical trials of such drugs. Haplotype information would be useful in
improving the efficiency and output of several steps in the drug
discovery and development process, including target validation,
identifying lead compounds and early phase clinical trials. The methods
are useful in screening for compounds targeting SCYA21 to treat a
specific condition or disease predicted to be associated with SCYA21
cativity, e.g. immunological disorders. This sequence represents an
in the SCYA21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes an isolated human pyridoxal (pyridoxine, vitamin B6) kinase, (PDXK) polynucleotide. The polynucleotide is useful in studying the expression and function of PDXK, and in expressing PDXK protein for use in screening for candidate drugs to treat PDXK related diseases and for therapeutic purposes. A transgenic animal is useful for studying expression of the PDXK isogenes in vivo, for in vivo screening and testing of drugs targeted against PDXK protein, and for testing the efficacy of therapeutic agains and compounds for autoimmune polyglandular disease type 1. The polypeptide is useful for studying the effect of the
                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated human pyridoxal (pyridoxine, vitamin B6) kinase polyNts, useful for therapeutic purposes, for studying the expression and function of the polyNt, and for expressing pyridoxal protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

variation on the biological activity of PDXK and the binding affinity of candidate drugs targeting PDXK for the treatment of autoimmune polyglandular disease type 1. Genoryping and haplotyping is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with PDXK activity, e.g., autoimmune polyglandular disease type 1, to validate PDXK as a candidate agent for treating a specific condition or disease predicted to be associated with PDXK activity, and in the design of predicted to be associated with PDXK activity, and in the design of candidate drugs. This sequence is one of 37 (see ABK16941-ABK16977) allele specific oligonucleotide (ASO) PCR primers used for detecting PDXK gene polymorphisms, described in the method of the

Haplotyping, (H1), the G-protein coupled receptor 4 (GPR4) gene of an individual, comprising determining which haplotype an individual.

Example 2; Page 31; 61pp; English.

The invention relates to G-protein coupled receptor 4 (GPR4) gene variants. The data about the GPR4 polynucleotides and polypeptides and the polymorphisms associated with them are useful for haplotyping at the GPR4 locus. Allele-specific oligonucleotide (ASO) is useful as probes and primers for assaying a polymorphism in GPR4 gene. The present sequence is human GPR4 isogene fragment

Genotyping a human UDP glycosyltransferase 1 gene of an individual for determining the haplotype of an individual, involves determining the identity of a nucleotide pair at specific polymorphic sites for two copies of the gene.

Claim 16; Page 13; 81pp; English.

The invention relates to genotyping a human UDP glycosyltransferase (UGTIA1) gene of an individual, involving determining for the two copies of the UGTIA1 gene present in the individual, the identity of the conclection pair at one or more polymorphic sites. The new method is useful for determining whether an individual has a haplotype or haplotype pairs, given in the specification. It is useful for improving the consider of drugs for treating diseases associated with UGTIA1 as a candidate agent for treating a specific condition or disease predicted to be associated with UGTIA1 activity, and in the disease predicted to be associated with UGTIA1 activity, and in the condition or disease predicted to be associated with UGTIA1 activity. The method is useful to screen for compounds targeting uGTIA1 to treat a specific condition or disease associated with UGTIA1 activity. The condition or disease associated with UGTIA1 activity. A nucleic specific condition or disease associated with UGTIA1 activity. A nucleic condition or disease associated with UGTIA1 activity. A nucleic scid (I) comprising a polymorphic variant of a reference sequence for the UGTIA1 is useful for its fragment is useful in studying the expression and function of UGTIA1, and in expressing UGTIA1 protein for activity. (I) or (II) is useful for treat diseases related to UGTIA1 ecombinant organism comprising (II) is useful for testing the efficacy of the UGTIA1 isogenes in vivo, for in vivo screening and testing of drugs therepoutic agents and compounds for disting the efficacy of the trapeutic agents and compounds for testing the efficacy of the trapeutic agents and compounds for file trapeutic algority appressing (II) or all pene allele-specific oligonucleotides used in the marked of the invention

The present invention describes a method for identifying oligomucleotides with desired hybridisation properties to nucleic acid targets containing secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligomucleotides which can interact with the folded target nucleic acid. Oligomucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HTV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying oligonuclectides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under
                                                                                                                                                                                                                                                Nucleic acid accessible hybridisation site; detection, hybridisation, characterisation, identification, nucleic acid structure, diagnosis; PCR primer; probe; ss.

The present invention describes an isolated polymucleotide (I) having a sequence (SI) comprising soluble carrier family 18 (vesicular monoamine), member 2 (SiclaBA2) isogenes with regions of a sequence (SS) of 40023 bp (see Abis1954), and defined by a corresponding set of polymorphisms whose locations and identities are given in the specification; or a sequence (S2) complementary to (SI). (I) has curinflammatory and neuroleptic activities, and can be used in gene therapy. Methods from the present invention can be used in gene therapy. Methods from the present invention can be used for haplotyping and genotyping the SIC18A2 gene in an individual. SIC18A2 is also known as the vesicular monoamine transporter (VMAT2). (I) is useful in studying the expression and function of SIC18A2, and in expressing the SIC18A2 correcting for candidate drugs to treat diseases

CC protein for use in screening for candidate drugs to treat diseases

CC protein for use in screening for candidate drugs to treat diseases

CC protein for use in screening SIC18A2 as well as on the binding affinity on the biological activity of SIC18A2 as well as on the binding affinity inflammatory diseases such as neuropsychiatric disorders involving componental process. The present sequence represents an allele specific constitution of the processor and specific (ASO) primer for human SIC18A2, which is given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel genetic variants of soluble carrier family 18 (vesicular monoamine), member 2 gene useful for screening drugs to treat diseases e.g. neuropsychiatric disorders involving monoaminergic brain systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Human; single nucleotide polymorphism; SNP; RANGAP1; haplotyphing chromosome 25413.2413.31; Ran GTPase activating protein 1; genotyping; cancer; irregular cell cycle associated disorder; ASO; probe; ss; allele-specific oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genotyping human Ran GTPase activating protein 1 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human Ran GTPase activating protein 1 (RANGAPI) gene located on chromosome 20413.2-413.1, and methods for haplotyping and/or genotyping the RANGAPI gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the RANGAPI gene polymorphisms. The polymucleotides and screened compounds are useful for treatment of diseases associated with RANGAPI activity, such as cancer and other disorders associated with an irregular cell cycle. AASI9704-AASI9742, represent ASO probes for detecting human RANGAPI gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human IL8RB gene allele-specific oligonucleotide sequencing primer #11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 0.5%; Score 11; DB 1; Length 15; Best Local Similarity 84.6%; Pred. The invention relates to single nucleotide polymorphisms in the human interleukin 8 receptor beta (ILBRB) gene. A method for haplotyping the interleukin 8 receptor beta (ILBRB) gene. A method for haplotyping the correct roles gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by an edited by one of the ILBRB haplotypes given in the copies seed that the same of the copies of the paper or specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotypes. An association between a trait and comparing the frequency of the haplotype or haplotype pair. In a corresponding by the trait population indicates the trait is associated with the haplotype or haplotype pair. ILBRB and its corresponding by expression and function of ILBRB activity, such as chronic obstructive pulmonary diseases related to ILBRB activity, such as chronic obstructive pulmonary disease and other inflammatory disease. The sequences are also useful for studying the effect of variation on the confidence drugs targeting ILBRB sequences AAS95525-AAS95579 represent confidence to detect ILBRB gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

The present invention relates to a new polypeptide comprising a sequence which is a polymorphic variant of a reference sequence for ADRB3 (Deta-3-denemental receptor) protein. The reference sequence comprises a sequence of 408 amino acids as given in the specification, or its fragment, and the of 408 amino acids as given in the specification, or its fragment, and of 408 amino acids and comprises one or more variant amino acids. The polymorphic variant comprises one or more variant amino acids. The polymorphic variants are useful in studying the expression and function of ADRB3, in expression and function of ADRB3 to treat diseases related to ADRB3 activity, in studying the effect of the variation on the biological activity of ADRB3, and the binding affinity of candidate drugs targeting ADRB3 for the treatment of disorders and an early onset of non-insulin-dependent diabetes mellitus. Haplotyping methods are useful in validating ADRB3 as a candidate target for treating a specific condition or disease predicted to be associated with ADRB3 activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with ADRB3 activity. The present nucleic acid sequence represents one of a collection of allele-specific oligonucleotide (ASO) primers (ABR11465- ABR11488) that were used in the methods of the invention to detect polymorphisms in the human ADRB3 gene
                                                                                                                                                                                                                                                                                                                                Novel genetic variants of beta-3-adrenergic receptor gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. obesity, non-insulin dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 15 BP; 2 A; 9 C; 0 G; 3 T; 0 U; 1 Other;

Choi JY, Chew A,

WPI; 2002-010724/01

New isolated polynucleotide which is polymorphic variant of phospholipid transfer protein (PLTP) gene, having any one of polymorphic sites PS1-PS25, for studying function of PLTP, and expressing PLTP protein.

Claim 15; Page 73; 99pp; English

The invention relates to single nucleotide polymorphisms in the gene encoding the human phospholipid transfer protein (PLTP). A method for encoding the pirp gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene in an individual comprises identifying the copies of the gene in a defined by a haplotype of in the specification or whether both copies are defined by a haplotype pair copair. This method is useful in genotyping, whereby all possible haplotype to pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair of the haplotype or haplotype pair of the haplotype or haplotype pair of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair in the trait population indicates the trait is associated with the thaplotype or haplotype pair. PLTP and its corresponding DNA are used for studying the expression and function of PLTP, for use in screening of or studying the expression and function of PLTP, for use in screening of or studying the expression and function of PLTP activity. The sequences are also useful for studying the effect of variation on the biological activity of PLTP as well as on the blinding affairinty of candidate drugs targeting PLTP for treating atherosolerosis. Sequences the informating primers and PCR primers used for detecting PLTP gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The cargumetic nucleic acid or ribozyme is in a harmerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ilbozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ilbozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was contained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                 New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a microarray comprising a support, a first probe for genotyping Mycobacterium apecies, second probe for differentiating Mycobacterium tuberculosis strains, and a third probe for detecting antibiotic-resistant strains, where the probes are immobilized on the support. This sequence represents an example of the third probe used for detecting antibiotic resistance in Mycobacterium strains. The array is useful for simultaneously genotyping Mycobacterium species, differentiating M. tuberculosis strains and detecting antibiotic-
use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Microarray; probe; Mycobacterium; antibiotic-resistance; genotyping; ss.

The zinzyme is used to inhibit expression, in human therapy of e.g. cancer), in diagnosing gene expression, in pharmaceutical, agricultural, research and diagnostic applications. Examples were given showing the optimisation of zinzymes targeting human K-ras and HERZ mRNA. The present sequence is a zinzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleoside triphosphate compound for use in inhibiting gene expression and in human therapy, such as, for the treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptemers that bind to HBV reverse transcriptase primer sequences, as well so oligonucleotides that specifically bind the Enhancer I region of HBV genes and/or HBV verse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HBV enzymatic nucleic acid sequence represents a substrate for one of the HBV conzymatic nucleic acid sequences disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel compound useful for treating cirrhosis, liver failure, heparocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                     Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus, HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative, disease state, HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lee P;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pavco P,
                                                                                                                         HBV enzymatic nucleic acid substrate sequence #89.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Morrissey D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 15 BP; 2 A; 6 C; 1 G; 0 T; 6 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Page 214; 387pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mcswiggen J,

A new method has been developed of breeding for corn with increased kernel oil concentration. The method comprises: (a) selecting a corn plant from a breeding population using at least one of the genetic compress s1375, s1384, s1394, s1415, s1457, s1480, s1476, s1484, s1545, s1536, s1537, s1480, s1476, s1756, s1757, s18172, s1774, s1813, s1816, s1767, s18172, s1774, s1927, s1937, s1818, s1816, s1937, s1936, s1937, s1931, s1933, cc s1939, s1936, s1936, s1936, s1936, s1937, s1937, s1933, s1936, s
